## Section A: Pure Mathematics

1 Find the three values of x for which the derivative of  $x^2e^{-x^2}$  is zero.

Given that a and b are distinct positive numbers, find a polynomial P(x) such that the derivative of  $P(x)e^{-x^2}$  is zero for x = 0,  $x = \pm a$  and  $x = \pm b$ , but for no other values of x.

**2** For any positive integer N, the function f(N) is defined by

$$f(N) = N\left(1 - \frac{1}{p_1}\right)\left(1 - \frac{1}{p_2}\right)\cdots\left(1 - \frac{1}{p_k}\right)$$

where  $p_1, p_2, \ldots, p_k$  are the only prime numbers that are factors of N. Thus  $f(80) = 80(1 - \frac{1}{2})(1 - \frac{1}{5})$ .

- (a) (i) Evaluate f(12) and f(180).
  - (ii) Show that f(N) is an integer for all N.
- (b) Prove, or disprove by means of a counterexample, each of the following:
  - (i) f(m)f(n) = f(mn);
  - (ii) f(p)f(q) = f(pq) if p and q are distinct prime numbers;
  - (iii) f(p)f(q) = f(pq) only if p and q are distinct prime numbers.
- (c) Find a positive integer m and a prime number p such that  $f(p^m) = 146410$ .
- **3** Give a sketch, for  $0 \le x \le \pi/2$ , of the curve

$$y = (\sin x - x \cos x) ,$$

and show that  $0 \le y \le 1$ .

Show that:

(i) 
$$\int_0^{\pi/2} y \, \mathrm{d}x = 2 - \frac{\pi}{2}$$
;

(ii) 
$$\int_0^{\pi/2} y^2 dx = \frac{\pi^3}{48} - \frac{\pi}{8}.$$

Deduce that  $\pi^3 + 18\pi < 96$ .

4 The positive numbers a, b and c satisfy  $bc = a^2 + 1$ . Prove that

$$\arctan\left(\frac{1}{a+b}\right) + \arctan\left(\frac{1}{a+c}\right) = \arctan\left(\frac{1}{a}\right).$$

The positive numbers p, q, r, s, t, u and v satisfy

$$st = (p+q)^2 + 1$$
,  $uv = (p+r)^2 + 1$ ,  $qr = p^2 + 1$ .

Prove that

$$\arctan\!\left(\frac{1}{p+q+s}\right) + \arctan\!\left(\frac{1}{p+q+t}\right) + \arctan\!\left(\frac{1}{p+r+u}\right) + \arctan\!\left(\frac{1}{p+r+v}\right) = \arctan\!\left(\frac{1}{p}\right).$$

Hence show that

$$\arctan\left(\frac{1}{13}\right) + \arctan\left(\frac{1}{21}\right) + \arctan\left(\frac{1}{82}\right) + \arctan\left(\frac{1}{187}\right) = \arctan\left(\frac{1}{7}\right).$$

[Note that  $\arctan x$  is another notation for  $\tan^{-1} x$ .]

The angle A of triangle ABC is a right angle and the sides BC, CA and AB are of lengths a, b and c, respectively. Each side of the triangle is tangent to the circle  $S_1$  which is of radius r. Show that 2r = b + c - a.

Each vertex of the triangle lies on the circle  $S_2$ . The ratio of the area of the region between  $S_1$  and the triangle to the area of  $S_2$  is denoted by R. Show that

$$\pi R = -(\pi - 1)q^2 + 2\pi q - (\pi + 1) ,$$

where  $q = \frac{b+c}{a}$ . Deduce that

$$R \leqslant \frac{1}{\pi(\pi-1)}$$
.

6 (i) Write down the general term in the expansion in powers of x of  $(1-x)^{-1}$ ,  $(1-x)^{-2}$  and  $(1-x)^{-3}$ , where |x| < 1.

Evaluate 
$$\sum_{n=1}^{\infty} n2^{-n}$$
 and  $\sum_{n=1}^{\infty} n^2 2^{-n}$ .

(ii) Show that  $(1-x)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} \frac{(2n)!}{(n!)^2} \frac{x^n}{2^{2n}}$ , for |x| < 1.

Evaluate 
$$\sum_{n=0}^{\infty} \frac{(2n)!}{(n!)^2 2^{2n} 3^n}$$
 and  $\sum_{n=1}^{\infty} \frac{n(2n)!}{(n!)^2 2^{2n} 3^n}$ .

7 The position vectors, relative to an origin O, at time t of the particles P and Q are

$$\cos t \, \mathbf{i} + \sin t \, \mathbf{j} + 0 \, \mathbf{k}$$
 and  $\cos(t + \frac{1}{4}\pi) \left[ \frac{3}{2} \mathbf{i} + \frac{3\sqrt{3}}{2} \mathbf{k} \right] + 3\sin(t + \frac{1}{4}\pi) \, \mathbf{j}$ ,

respectively, where  $0\leqslant t\leqslant 2\pi$  .

- (i) Give a geometrical description of the motion of P and Q.
- (ii) Let  $\theta$  be the angle POQ at time t that satisfies  $0 \le \theta \le \pi$ . Show that

$$\cos \theta = \frac{3\sqrt{2}}{8} - \frac{1}{4}\cos(2t + \frac{1}{4}\pi) \ .$$

- (iii) Show that the total time for which  $\theta \geqslant \frac{1}{4}\pi$  is  $\frac{3}{2}\pi$ .
- 8 For  $x \ge 0$  the curve C is defined by

$$\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{x^3 y^2}{(1+x^2)^{5/2}}$$

with y = 1 when x = 0. Show that

$$\frac{1}{y} = \frac{2+3x^2}{3(1+x^2)^{3/2}} + \frac{1}{3}$$

and hence that for large positive x

$$y \approx 3 - \frac{9}{x} .$$

Draw a sketch of C.

On a separate diagram draw a sketch of the two curves defined for  $x \ge 0$  by

$$\frac{\mathrm{d}z}{\mathrm{d}x} = \frac{x^3 z^3}{2(1+x^2)^{5/2}}$$

with z = 1 at x = 0 on one curve, and z = -1 at x = 0 on the other.

## Section B: Mechanics

Two particles, A and B, of masses m and 2m, respectively, are placed on a line of greatest slope,  $\ell$ , of a rough inclined plane which makes an angle of  $30^{\circ}$  with the horizontal. The coefficient of friction between A and the plane is  $\frac{1}{6}\sqrt{3}$  and the coefficient of friction between B and the plane is  $\frac{1}{3}\sqrt{3}$ . The particles are at rest with B higher up  $\ell$  than A and are connected by a light inextensible string which is taut. A force P is applied to B.

- (i) Show that the least magnitude of P for which the two particles move upwards along  $\ell$  is  $\frac{11}{8}\sqrt{3}\,mg$  and give, in this case, the direction in which P acts.
- (ii) Find the least magnitude of P for which the particles do not slip downwards along  $\ell$ .
- The points A and B are 180 metres apart and lie on horizontal ground. A missile is launched from A at speed of  $100\,\mathrm{m\,s^{-1}}$  and at an acute angle of elevation to the line AB of  $\arcsin\frac{3}{5}$ . A time T seconds later, an anti-missile missile is launched from B, at speed of  $200\,\mathrm{m\,s^{-1}}$  and at an acute angle of elevation to the line BA of  $\arcsin\frac{4}{5}$ . The motion of both missiles takes place in the vertical plane containing A and B, and the missiles collide.

Taking  $g = 10 \,\mathrm{m \, s^{-2}}$  and ignoring air resistance, find T.

[Note that  $\arcsin \frac{3}{5}$  is another notation for  $\sin^{-1} \frac{3}{5}$ .]

A plane is inclined at an angle  $\arctan \frac{3}{4}$  to the horizontal and a small, smooth, light pulley P is fixed to the top of the plane. A string, APB, passes over the pulley. A particle of mass  $m_1$  is attached to the string at A and rests on the inclined plane with AP parallel to a line of greatest slope in the plane. A particle of mass  $m_2$ , where  $m_2 > m_1$ , is attached to the string at B and hangs freely with BP vertical. The coefficient of friction between the particle at A and the plane is  $\frac{1}{2}$ .

The system is released from rest with the string taut. Show that the acceleration of the particles is  $\frac{m_2 - m_1}{m_2 + m_1}g$ .

At a time T after release, the string breaks. Given that the particle at A does not reach the pulley at any point in its motion, find an expression in terms of T for the time after release at which the particle at A reaches its maximum height. It is found that, regardless of when the string broke, this time is equal to the time taken by the particle at A to descend from its point of maximum height to the point at which it was released. Find the ratio  $m_1: m_2$ .

[Note that  $\arctan \frac{3}{4}$  is another notation for  $\tan^{-1} \frac{3}{4}$ .]

## Section C: Probability and Statistics

The twins Anna and Bella share a computer and never sign their e-mails. When I e-mail them, only the twin currently online responds. The probability that it is Anna who is online is p and she answers each question I ask her truthfully with probability a, independently of all her other answers, even if a question is repeated. The probability that it is Bella who is online is q, where q = 1 - p, and she answers each question truthfully with probability b, independently of all her other answers, even if a question is repeated.

- (i) I send the twins the e-mail: 'Toss a fair coin and answer the following question. Did the coin come down heads?'. I receive the answer 'yes'. Show that the probability that the coin did come down heads is  $\frac{1}{2}$  if and only if 2(ap + bq) = 1.
- (ii) I send the twins the e-mail: 'Toss a fair coin and answer the following question. Did the coin come down heads?'. I receive the answer 'yes'. I then send the e-mail: 'Did the coin come down heads?' and I receive the answer 'no'. Show that the probability (taking into account these answers) that the coin did come down heads is  $\frac{1}{2}$ .
- (iii) I send the twins the e-mail: 'Toss a fair coin and answer the following question. Did the coin come down heads?' I receive the answer 'yes'. I then send the e-mail: 'Did the coin come down heads?' and I receive the answer 'yes'. Show that, if 2(ap + bq) = 1, the probability (taking into account these answers) that the coin did come down heads is  $\frac{1}{2}$ .
- 13 The number of printing errors on any page of a large book of N pages is modelled by a Poisson variate with parameter  $\lambda$  and is statistically independent of the number of printing errors on any other page. The number of pages in a random sample of n pages (where n is much smaller than N and  $n \ge 2$ ) which contain fewer than two errors is denoted by Y. Show that  $P(Y = k) = \binom{n}{k} p^k q^{n-k}$  where  $p = (1 + \lambda)e^{-\lambda}$  and q = 1 p.

Show also that, if  $\lambda$  is sufficiently small,

- (i)  $q \approx \frac{1}{2}\lambda^2$ ;
- (ii) the largest value of n for which  $P(Y = n) \ge 1 \lambda$  is approximately  $2/\lambda$ ;
- (iii)  $P(Y > 1 \mid Y > 0) \approx 1 n(\lambda^2/2)^{n-1}$ .

14 The probability density function f(x) of the random variable X is given by

$$f(x) = k \left[ \phi(x) + \lambda g(x) \right],$$

where  $\phi(x)$  is the probability density function of a normal variate with mean 0 and variance 1,  $\lambda$  is a positive constant, and g(x) is a probability density function defined by

$$g(x) = \begin{cases} 1/\lambda & \text{for } 0 \le x \le \lambda; \\ 0 & \text{otherwise.} \end{cases}$$

Find  $\mu$ , the mean of X, in terms of  $\lambda$ , and prove that  $\sigma$ , the standard deviation of X, satisfies.

$$\sigma^2 = \frac{\lambda^4 + 4\lambda^3 + 12\lambda + 12}{12(1+\lambda)^2} \ .$$

In the case  $\lambda = 2$ :

- (i) draw a sketch of the curve y = f(x);
- (ii) express the cumulative distribution function of X in terms of  $\Phi(x)$ , the cumulative distribution function corresponding to  $\phi(x)$ ;
- (iii) evaluate  $P(0 < X < \mu + 2\sigma)$ , given that  $\Phi(\frac{2}{3} + \frac{2}{3}\sqrt{7}) = 0.9921$ .
